Facts About Sharks

- There are over 500 species of sharks.
- The largest shark is the whale shark, which can grow up to 40 feet long.
- The smallest shark is the dwarf lantern shark, which is only about 6 inches long.

- Sharks have been around for over 400 million years.
- Sharks do not have bones. Instead, their skeletons are made of cartilage.
- Sharks have a keen sense of smell. They can detect blood from miles away.
- Sharks have rows of sharp teeth. They can lose up to 3,000 teeth in their lifetime.
- Sharks are apex predators. They play an important role in maintaining the health of the ocean ecosystem.

Diet

Sharks are carnivores and their diet consists mainly of fish, squid, and marine mammals. Some sharks, such as the great white shark, are apex predators and will eat anything they can catch, including seals, sea lions, and even other sharks. Other sharks, such as the nurse shark, are bottom feeders and will eat anything they can find on the ocean floor, including crustaceans, mollusks, and small fish.

Habitat

Sharks can be found in all oceans of the world, from the shallows to the deep sea. Some sharks, such as the tiger shark, are coastal species and can be found near beaches and estuaries. Other sharks, such as the great white shark, are pelagic species and can be found in the open ocean far from land.

Information

Sharks are fascinating creatures that play an important role in the health of the ocean ecosystem. They are also a popular target for fishing, both for sport and for food. However, shark populations are declining due to overfishing and habitat loss. It is important to protect sharks and ensure their survival for future generations.

Here are some additional resources for learning more about sharks:

- National Geographic: Sharks
- Discovery Channel: Sharks
- Oceana: Sharks and Rays

The great white shark is one of the most iconic and feared sharks in the world.
